

Technical Interview Structure

Part 1: Take-Home Assignment & Live Git (20 Minutes)

Objective: Verify foundational software engineering skills, Git proficiency, and cloud deployment familiarity.

The Take-Home Task (Completed Prior to the Interview)

- **Application:** Build a simple web application featuring a functional login mechanism. (Filler content is completely fine, provided it is appropriate). Can be simple as 3 pages (welcome with login, logged in page, not logged in page).
- **Source Control:** The project must be managed in a repository utilizing at least a main branch and a development branch to demonstrate standard Git workflow knowledge.
- **Deployment:** The application must be hosted on AWS / Azure / GCP. **No local host (localhost) presentations.**
- **Bonus Points:** Implementation of basic security tooling within the repository or infrastructure (e.g., SAST scanners, dependency checkers, or secure cloud configurations, terraform).
- **Negative Points:** Poor security standards.

Live Session Expectation

This will be a hands-on technical walkthrough. I will ask you to share your screen and use the terminal (or your preferred Git tool) to complete a live demo. I do not mind the use of AI to build this, but if you can't explain what the code is doing nor can you use git to make changes, you are not technical. If you already have something like this as a past project, it is acceptable to refactor if necessary for the requirements.

You will be asked to:

1. Create a new feature/fix branch.
2. Implement a quick code change suggested during the call.
3. Merge that branch back into main.
4. Push the updated main branch live to production to show a successful deployment.
5. Confirm that the change is in production.

Part 2: Live Threat Modeling Session (20 Minutes)

Objective: Evaluate your ability to identify design flaws, system vulnerabilities, and propose practical mitigations in real-time.

Live Session Expectation

What to expect during the call: We will look at a specific architectural scenario together and I'll have you lead the threat modelling discussion. You can choose STRIDE or DREAD, any framework as long as it covers the fundamentals.

Part 3: The Day-in-the-Life Scenario (20 Minutes)

Objective: Test critical thinking, risk prioritization, and communication skills under realistic workplace scenarios.

Live Session Expectation

What to expect during the call: I will present you with 2–3 real-world scenarios that mirror the day-to-day tasks of our security team.

Important Note: Being right the first time is *not* the goal here. This exercise is designed to show me your **thought process**. I want to see how you approach ambiguity, how you ask clarifying questions, and how you logically deduce your way to the right answer in the end. Sometimes we have to evaluate multiple options first before deciding a proper path.

If you are unable to complete these parts in this order, I will end the interview early and thank you for your time.
